Mathematics Autumn 2026

Calculus I

MATH 1951 · CRN 1669 · Undergraduate

Calculus is the study of functions on the continuum, their variations, their summations, and other such notions. The fundamental tool of calculus is the idea of limits and the rigorous notion of approximation. It is the foundation of all modern science, the language which we use to model the world, and the greatest discovery by the greatest minds. This course introduces the first notion of limits, and applies it to derivation, or difference in a continuum world.

The mean value theorem

$$f'(c) = \frac{f(b) - f(a)}{b - a}, \qquad a < c < b$$

Topics

- Limits and continuity
- Extreme value theorem and intermediate value theorem
- Derivation
- Mean value theorem
- Applications: monotonicity, convexity, optimization

Instructor

Prof. Frédéric Latrémolière

Meetings

Tuesdays & Thursdays
12:00–1:50 p.m.
CC 150

September 8–November 16

TA session

Fridays
12:00–12:50 p.m.
Olin 205
